Remedy Applications 19 Dec. 1994

THE GLANDS

+N.B. The Enteric N.S. consists of nerve fibres (plexus?) along the entire length of the small intestine. It controls peristalsis and the absorption of nutrients.

Notes

The Pineal gland may influence pituitary/medullary adrenal/gonad function.

The hypothalamus is the main regulator of the endocrine system via the pituitary gland. It secretes release hormone for the anterior lobe, and control hormones for the posterior lobe of the pituitary.

The Pituitary secretes hormones as follows:

Anterior lobe:

- Growth hormone (GH) (Somatotropin) → Liver
- Adrenocorticotrophin (ACTH)
- Thyrotrophin (Thyroid stimulating -TSH)
- Prolactin (luteotrophic -LTH)
- Follicle stimulating hormone (FSH)
- Interstitial cell stimulating (ICSH)
- Melanocyte stimulating (MSH)

Posterior lobe:

- Vasopressin (Anti-diuretic: ADR)
- Oxytocin

The Thyroid gland:

- Thyroxine
- Calcitonin

The Parathyroid glands:

- Parathormone

The Thymus:

- T hormone to produce T cells

The Islets of Langerhans produce:

- Insulin
- Glucagon

The Adrenal Glands produce:

- Adrenaline & Noradrenalin (Medulla)
- Glucocorticoids (Cortisol)
- Mineralocorticoids (Aldosterone)
- Sex hormones: androgens & estrogens

The Liver produces: Somatomedins

The testicles produce: androgens (endocrine) / sperms (exocrine)

The ovaries produce: estrogen (endocrine) - /ova - progesterone (exocrine)
